<HEAD><TITLE>My Webpage!!! </TITLE>
<META optional stuff for search engines to look at>
</META>
<SCRIPT SRC=optional Javascript>
</SCRIPT>
</HEAD>
<!-- Comment in HTML -->
<BODY>
<H1>THE LARGEST HEADING AVAILABLE</H1>
<H2>Second largest Heading </H2>
<H8> Smallest heading available </H8>
<CENTER>text becomes centered</CENTER>
<B>Text becomes bold</B>
<U>Text is Underlined</U>
<I>Text is Italicized</I>
<!-- Nesting Tags... You can do multiple things, i.e. say I want to center and bold something -->
<CENTER><B>This text is centered and in bold</B></CENTER>
<!-- if you want only a certain part formatted differently, apply tags to that section -->
<B>This is bolded but only <U>this part is underlined</U></B>
<!-- Actual Text... Normally you want to write a little bit more information than just simple lines
of text, this is where the paragraph tag <P></P> comes in -->
<P> this is a paragraph, the text will naturally wrap if it gets too far from the screen sort
of like this. If you want to insert a Carriage-Return or “enter” simply put in the break line
tag like this<BR>
The text will then continue on the next line. Multiple Break tags will cause several blank
lines to be inserted<BR>
<BR>
<BR>
</P>
<!-- Pictures Inserting pictures are even easier than links. NOTE: there is no closing tag-->
<IMG SRC= “www.address.of.picture.gif/jpg/png”>

<!--Links Inserting a link to another webpage or file is very easy using the Anchor tag-->
<A HREF= “www.address.of.other.webpage”>Text you want the person to click on</A>

</BODY>
